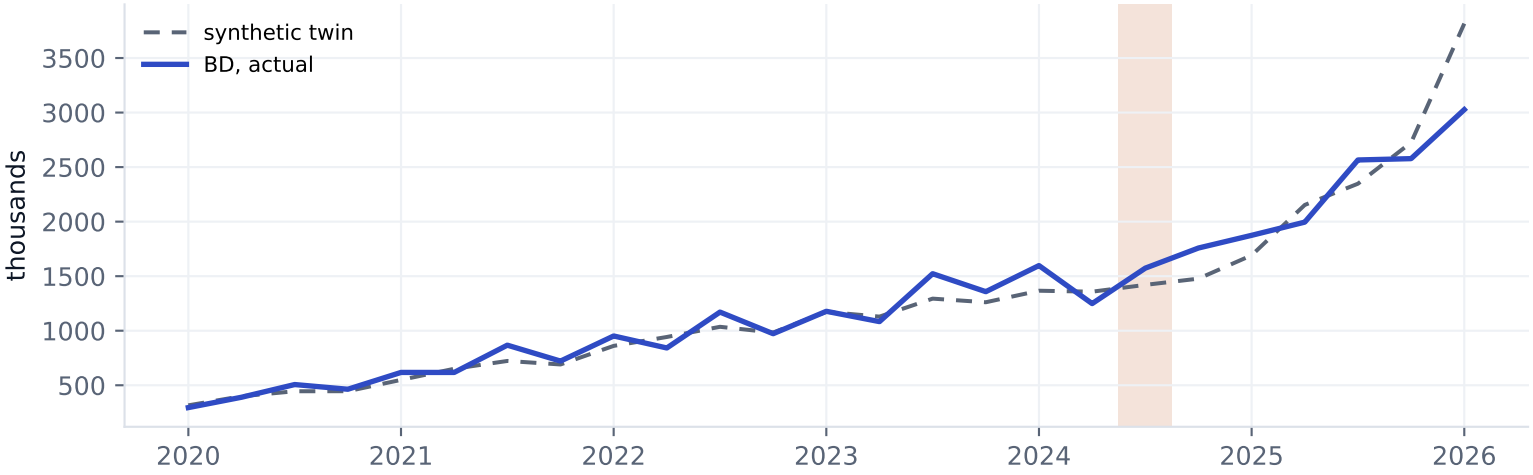
Bangladesh, 2024

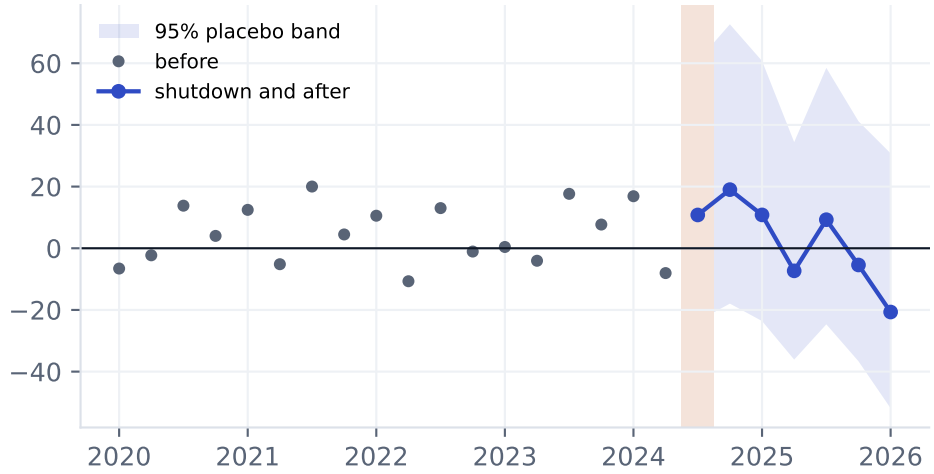
Change in git pushes attributed to BD in 2024Q3 vs a synthetic twin (106 donor economies, 18 pre quarters)

Method	vs twin	95% interval	p normal	p perm
Synthetic DiD	+10.8%	-24% to +61%	0.589	0.150
Synthetic control	+6.1%	-22% to +45%	0.708	0.402
Augmented synthetic control	-1.2%	-25% to +30%	0.933	0.841

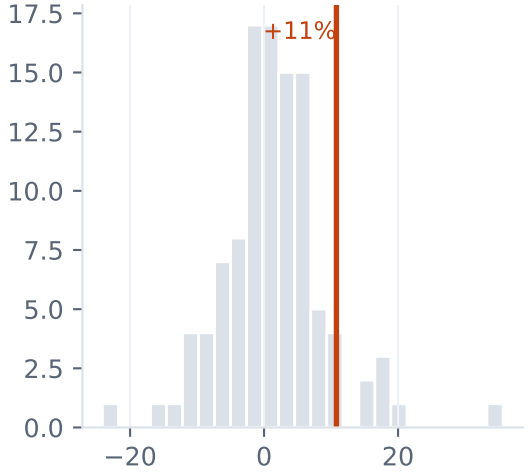
Git pushes per quarter, attributed to BD



Gap to the twin (%)



Same design run on every donor (%)



- Conformal test. p = 0.789. With 19 quarters the smallest possible p is 0.053, so this test can't give an interval here.
- Backdating. Fitting without 2024Q1 and 2024Q2, the twin misses those quarters by +4%, -20%. Inside the placebo band.
- Breakdown. The interval already includes zero, so there is nothing to break.
- Leave one donor out. Dropping each of the 18 donors with weight over 1% keeps the estimate between +9.7% and +12.1%.
- Holm adjusted p across the nine registry events is 1.000. Does not pass every check in the analysis plan, so I don't call it a clear drop.
- What happened. Nationwide shutdown from 18 Jul 2024, broadband back 24 Jul, mobile back 28 Jul, second nationwide cut 4 to 5 Aug. Source https://en.wikipedia.org/wiki/2024_Bangladesh_internet_blackouts
