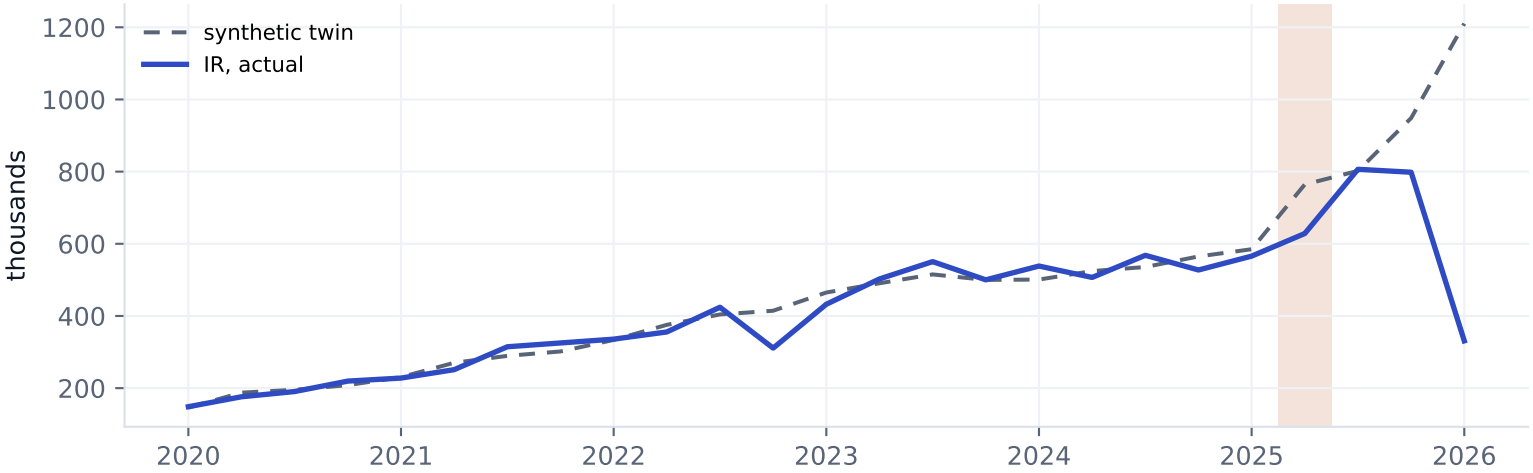
Iran, 2025

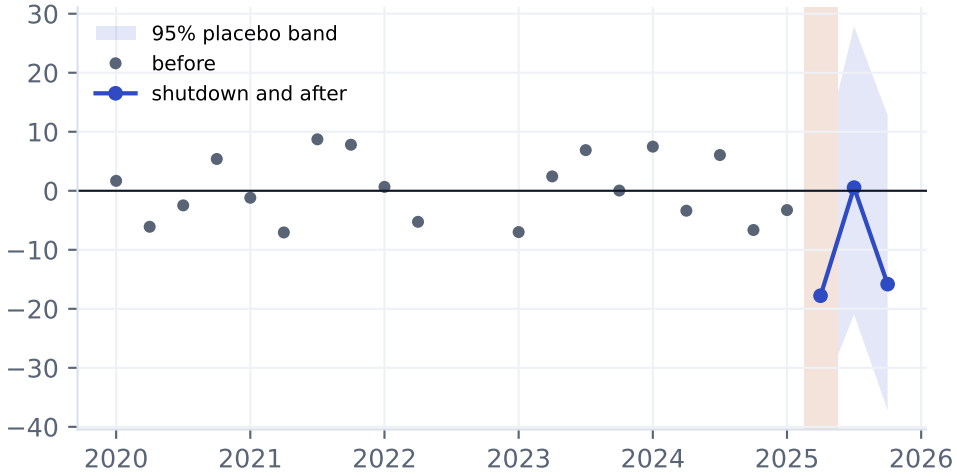
Change in git pushes attributed to IR in 2025Q2 vs a synthetic twin (106 donor economies, 19 pre quarters)

Method	vs twin	95% interval	p normal	p perm
Synthetic DiD	-17.8%	-35% to +5%	0.111	0.075
Synthetic control	-20.4%	-38% to +2%	0.071	0.037
Augmented synthetic control	-17.5%	-36% to +6%	0.127	0.065

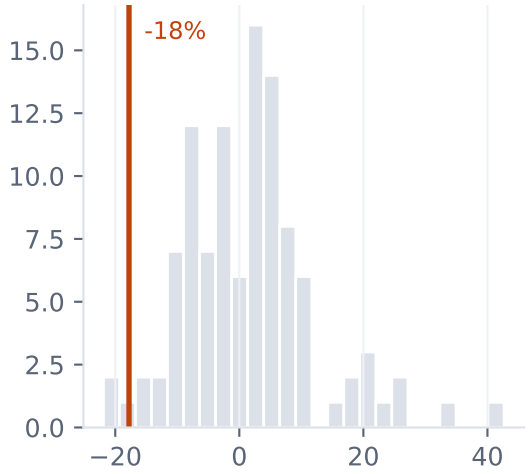
Git pushes per quarter, attributed to IR



Gap to the twin (%)



Same design run on every donor (%)



- Conformal test. p = 0.100 (smallest possible 0.050), interval -33% to +0%.
- Backdating. Fitting without 2024Q4 and 2025Q1, the twin misses those quarters by -14%, -12%. Inside the placebo band.
- Breakdown. The interval already includes zero, so there is nothing to break.
- Leave one donor out. Dropping each of the 28 donors with weight over 1% keeps the estimate between -19.0% and -16.4%.
- Holm adjusted p across the nine registry events is 0.664. Does not pass every check in the analysis plan, so I don't call it a clear drop.
- What happened. Connectivity fell sharply on 17 Jun 2025 and was almost completely blocked from 18 Jun, services restored 25 Jun 2025. Source https://en.wikipedia.org/wiki/2025_Internet_blackout_in_Iran
