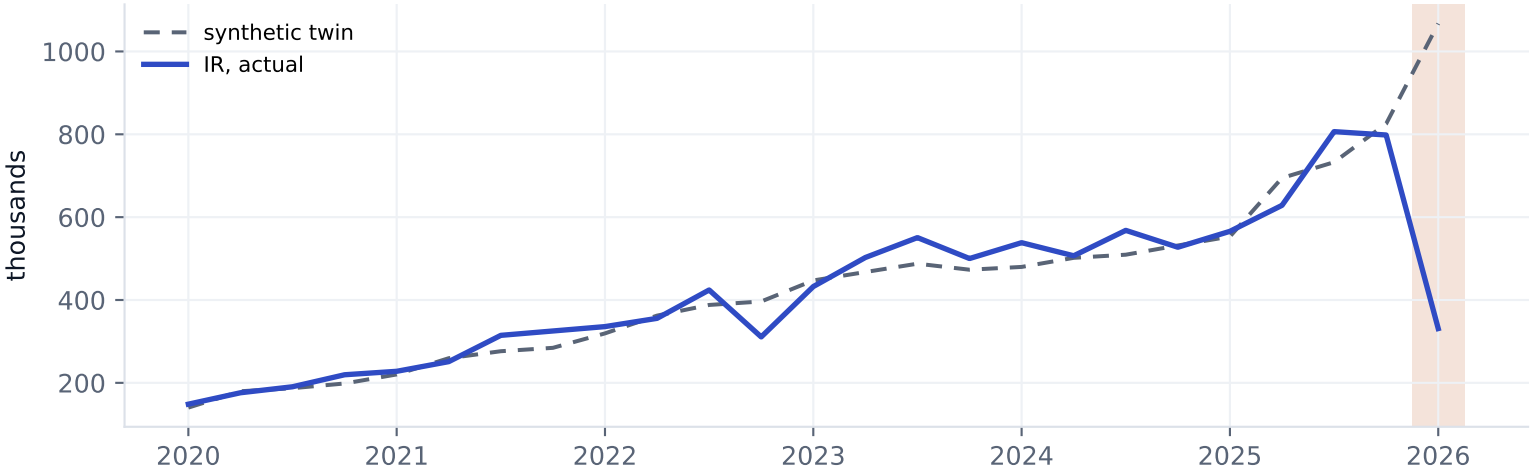
# Iran, 2026

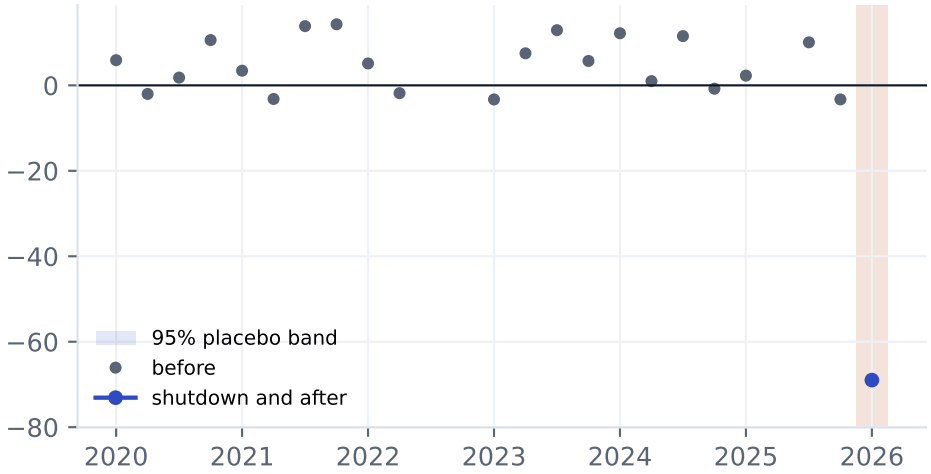
Change in git pushes attributed to IR in 2026Q1 vs a synthetic twin (106 donor economies, 21 pre quarters)

| Method | vs twin | 95% interval | p normal | p perm |
|---|---|---|---|---|
| Synthetic DiD | -69.0% | -76% to -61% | <0.001 | 0.009 |
| Synthetic control | -70.4% | -77% to -62% | <0.001 | 0.009 |
| Augmented synthetic control | -70.4% | -77% to -62% | <0.001 | 0.009 |

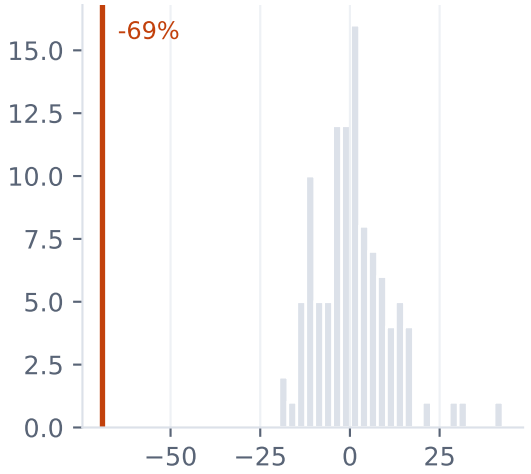
Git pushes per quarter, attributed to IR



Gap to the twin (%)



Same design run on every donor (%)



- Conformal test. p = 0.045 (smallest possible 0.045), interval -79% to -65%.
- Backdating. Fitting without 2025Q3 and 2025Q4, the twin misses those quarters by +2%, -15%. Inside the placebo band.
- Breakdown. The twin's path would have to be off by 3.4 times the worst miss in the country's own past (fake events in earlier quarters) before the result goes away.
- Leave one donor out. Dropping each of the 31 donors with weight over 1% keeps the estimate between -69.2% and -68.7%.
- Holm adjusted p across the nine registry events is <0.001. Passes every check in the analysis plan.
- The twin rises with the jump of about 30% most economies had this quarter. Of four economies under broad sanctions, Russia, Belarus and Cuba mostly didn't get it and Venezuela did (+48%). If Iran had grown like the four on average, or stayed flat, the drop is 59% (flat) to 64% (growing like those economies) instead of 69%.
- What happened. Blackout from 8 Jan 2026 with partial return in late January, then a cut of more than 99 percent from 28 Feb 2026 that lasted past the end of the quarter. Source https://www.thenationalnews.com/future/technology/2026/05/07/iran-internet-blackout/
