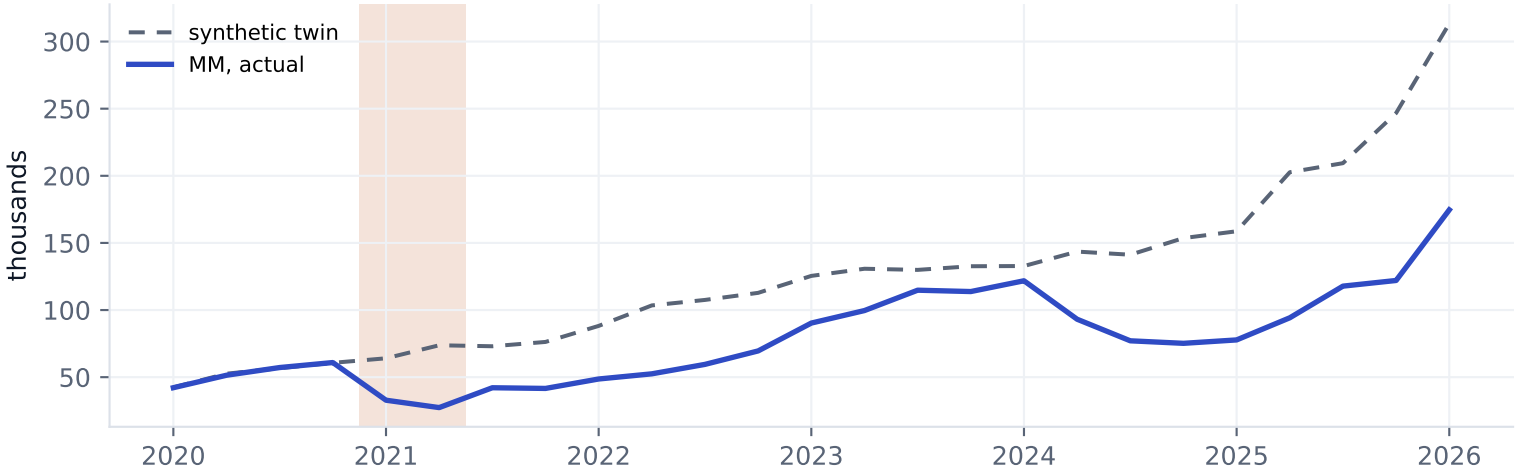
Myanmar, 2021

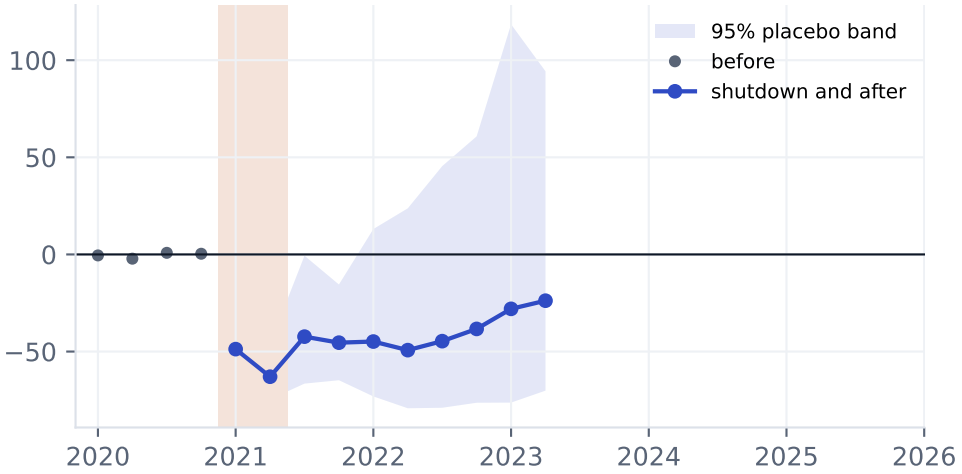
Change in git pushes attributed to MM in 2021Q1, 2021Q2 vs a synthetic twin (106 donor economies, 4 pre quarters)

Method	vs twin	95% interval	p normal	p perm
Synthetic DiD	-56.4%	-69% to -39%	<0.001	0.019
Synthetic control	-56.8%	-70% to -38%	<0.001	0.019
Augmented synthetic control	-56.8%	-70% to -37%	<0.001	0.019

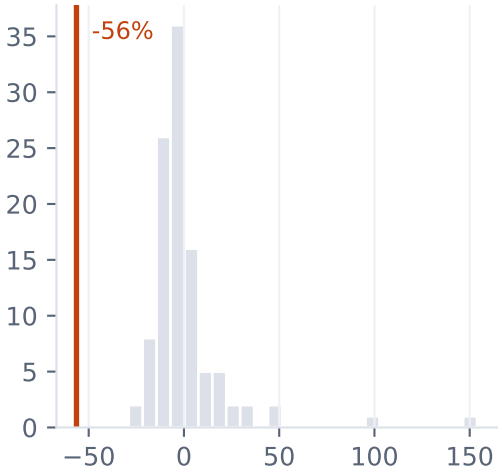
Git pushes per quarter, attributed to MM



Gap to the twin (%)



Same design run on every donor (%)



- Conformal test. p = 0.167. With 6 quarters the smallest possible p is 0.167, so this test can't give an interval here.
- Backdating. Too few pre quarters to hold any out.
- Breakdown. The twin's path would have to be off by 22.7 times the worst miss in the pre period fit (a weaker benchmark, there is too little history for fake events) before the result goes away.
- Leave one donor out. Dropping each of the 42 donors with weight over 1% keeps the estimate between -56.9% and -55.8%.
- Holm adjusted p across the nine registry events is <0.001. Passes every check in the analysis plan that can be run on it. Backdating can't, there are too few quarters before the event.
- What happened. Coup on 1 Feb 2021, 30 hour nationwide cut on 6 to 7 Feb, nightly cuts from 15 Feb to 28 Apr, all mobile data off from 15 Mar, then whitelisting. Source https://www.article19.org/resources/myanmar-must-immediately-reinstate-internet-access/
