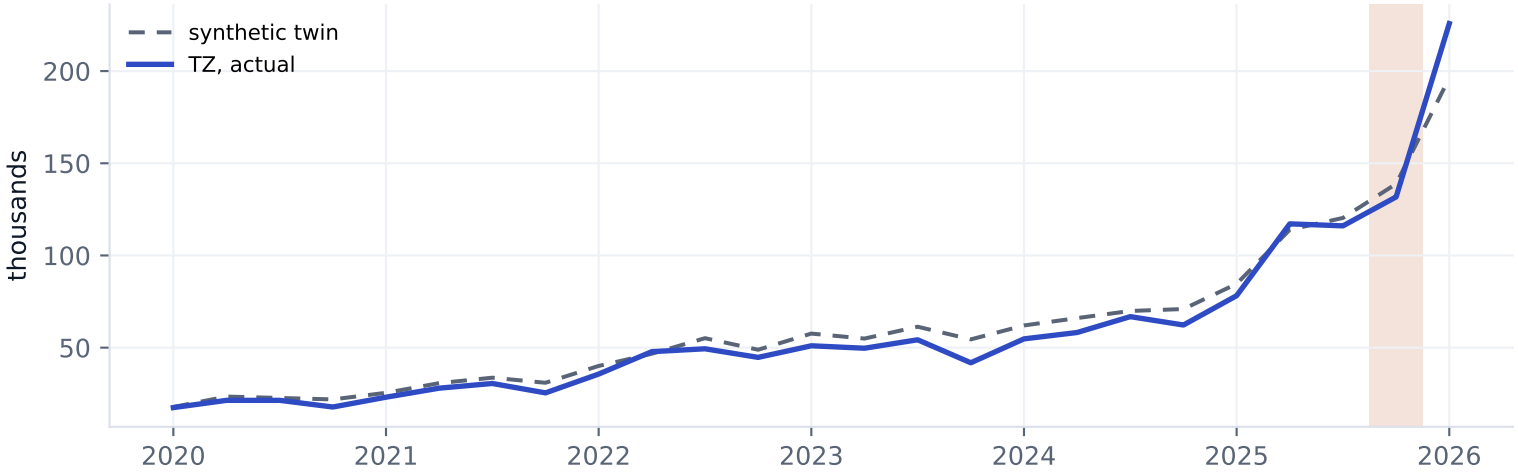
# Tanzania, 2025

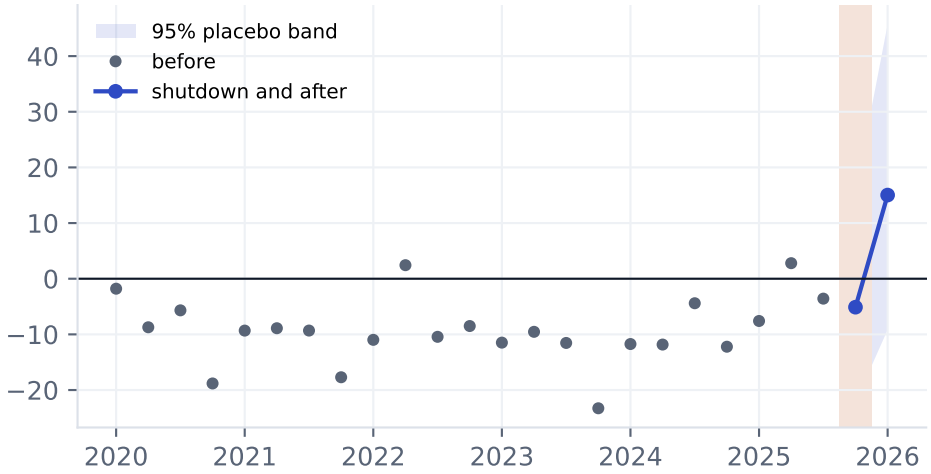
Change in git pushes attributed to TZ in 2025Q4 vs a synthetic twin (106 donor economies, 23 pre quarters)

| Method | vs twin | 95% interval | p normal | p perm |
|---|---|---|---|---|
| Synthetic DiD | -5.1% | -22% to +16% | 0.604 | 0.430 |
| Synthetic control | +4.1% | -16% to +30% | 0.719 | 0.589 |
| Augmented synthetic control | +1.2% | -17% to +23% | 0.905 | 0.813 |

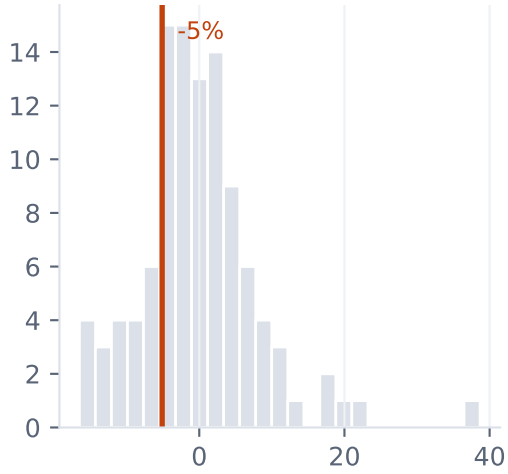
Git pushes per quarter, attributed to TZ



Gap to the twin (%)



Same design run on every donor (%)



- Conformal test. p = 0.458 (smallest possible 0.042), interval -21% to +46%.
- Backdating. Fitting without 2025Q2 and 2025Q3, the twin misses those quarters by +21%, +13%. Inside the placebo band.
- Breakdown. The interval already includes zero, so there is nothing to break.
- Leave one donor out. Dropping each of the 18 donors with weight over 1% keeps the estimate between -6.8% and -3.7%.
- Holm adjusted p across the nine registry events is 1.000. Does not pass every check in the analysis plan, so I don't call it a clear drop.
- What happened. Nationwide shutdown from 29 Oct 2025, general access restored 3 Nov 2025. Source https://globalnetworkinitiative.org/wp-content/uploads/GNI-Statement-on-the-Nationwide-Internet-Shutdown-in-Tanzania-During-the-2025-Elections-3.pdf
